

I. Modelación de la maniobrabilidad del canal de acceso a Guayaquil

La maniobrabilidad de un buque es importante ya que nos permite conocer si el Canal de Acceso diseñado es el adecuado para que los buques que arriban al puerto sean controlables en el plano horizontal. Es decir, que el buque de diseño pueda seguir trayectorias rectas, curvas, evadir obstáculos, etc. ya sea en mar o en agua dulce; bajo condiciones de oleaje o vientos, fuertes o débiles.

Además, la modelación de la maniobrabilidad permite ver si el buque seguirá su curso dentro del canal de acceso diseñado sin problemas, de no ser así, las condiciones físicas del canal tendrían que ser modificadas.

Por ello, una vez calculado el ancho del canal de acceso a Guayaquil, se modeló la maniobrabilidad del buque de diseño para determinar si las dimensiones propuestas son las adecuadas para que éste ingrese al Puerto de Guayaquil sin problemas. Dicha modelación se realizó por medio del modelo Shipma 6.2.

El buque de diseño que se consideró es un buque portacontenedores el cual ya se encuentra pre-cargado en el modelo.

II. Zonas de interés

Para la modelación se eligieron tres zonas de interés, en las cuales se han reportado dificultades para la navegación por parte de los Prácticos, las cuales se describen a continuación. Los parámetros que se utilizaron para la modelación de la maniobrabilidad son los parámetros de corriente y batimetría de cada zona. Los valores de corriente para las tres zonas se presentan al final de este anexo.

Zona de Los Goles

La primera zona es la zona de Los Goles, comprendida entre la Boya 7 (10+850 km) y la Bpya 13 (19+150 km). En esta zona se tienen dos tipos de materiales diferentes en el fondo, roca y material suave. Además de contar con la presencia de correas, lo que hace más difícil el manejo de las embarcaciones.

Figura 2 Campo de corriente (rojo) y batimetría (azul) de la zona de los Goles

Zona de Roca Seiba

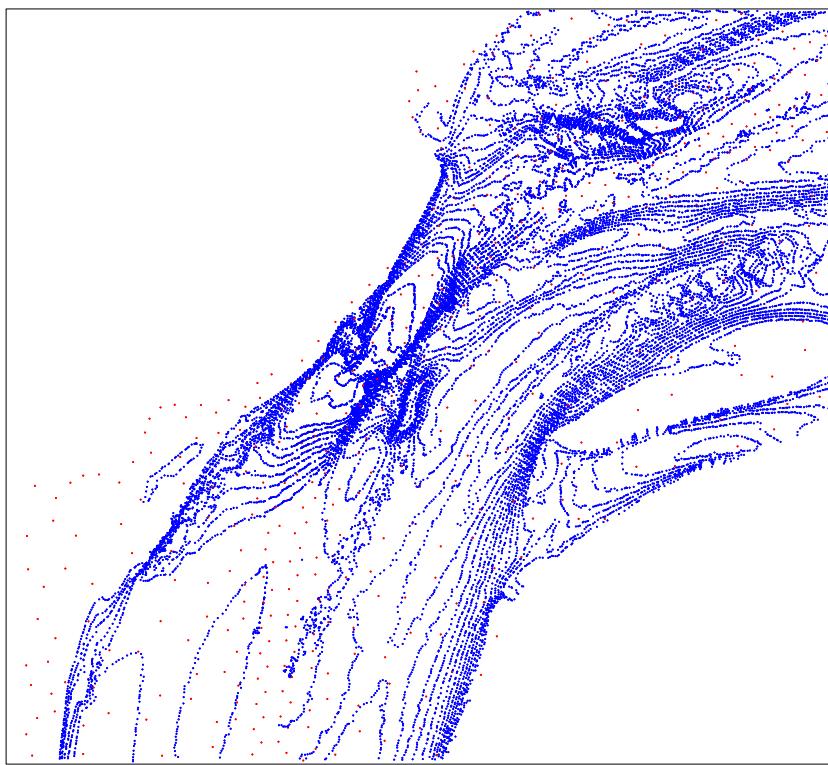

La zona de Roca Seiba es la comprendida entre la Boya 17 (31+600 km) a la Boya 33 (46+900), el material de fondo en esta zona es suave. En esta, se presentan restricciones de profundidad así como problemas con el cambio brusco de rumbo (caída) de la embarcación, de acuerdo a los comentarios realizados por los Prácticos del puerto.

Zona de cuarentena

Esta zona es la comprendida entre la Boya 75 (88+100 km) y la Boya (92+800), el material que se tiene aquí es suave. Aquí se presentan problemas de viraje o caída de la embarcación.

III. Descripción del modelo Shipma 6.2

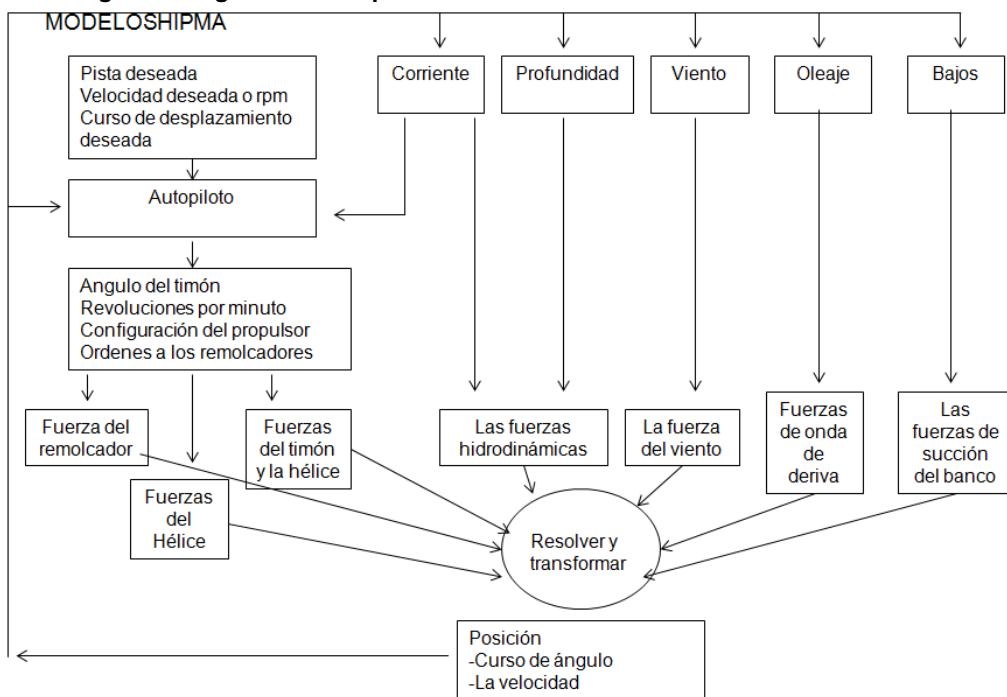

SHIPMA6 es un programa de simulación del comportamiento de maniobrabilidad de embarcaciones desarrollado en conjunto por el Maritime Research Institute Netherlads (MSCN) y WL/DELFT Hydraulics, el cual permite simular matemáticamente el comportamiento en maniobras de naves en puertos así como en canales de navegación.

| | | | |

| Asociación Geoestudios – Consusua | Contrato No. 41 – 2011 | Fecha: Julio 2012 | 4 |

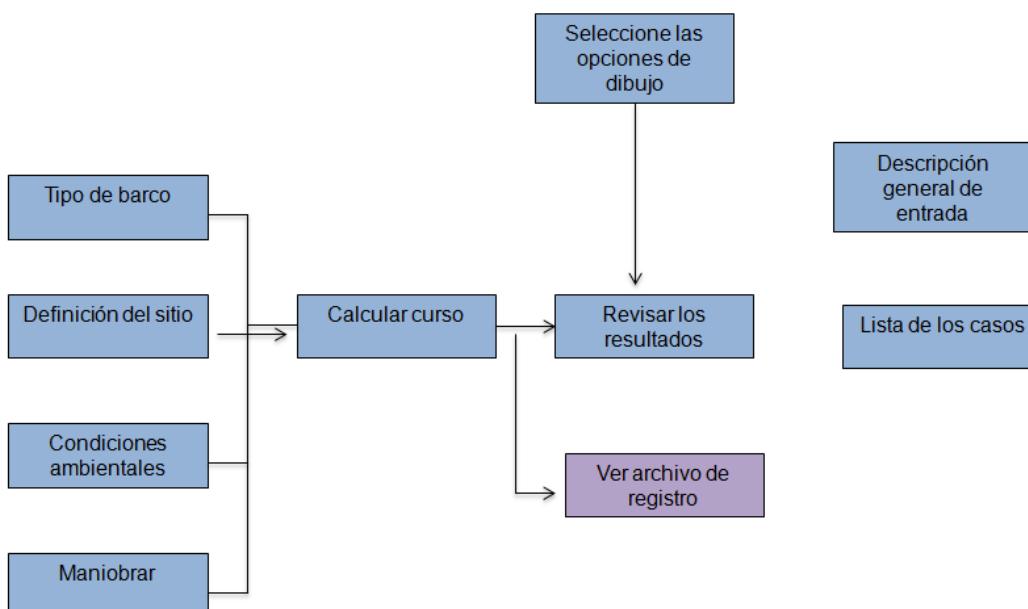

La maniobrabilidad matemática del programa se describe de manera esquemática y sencilla en el siguiente diagrama de bloques.

Figura 7 Diagrama de bloques de la maniobrabilidad matemática del modelo

El proceso de cálculo del programa se muestra de manera esquemática en el siguiente diagrama de flujo que sigue el programa para el cálculo es el siguiente:

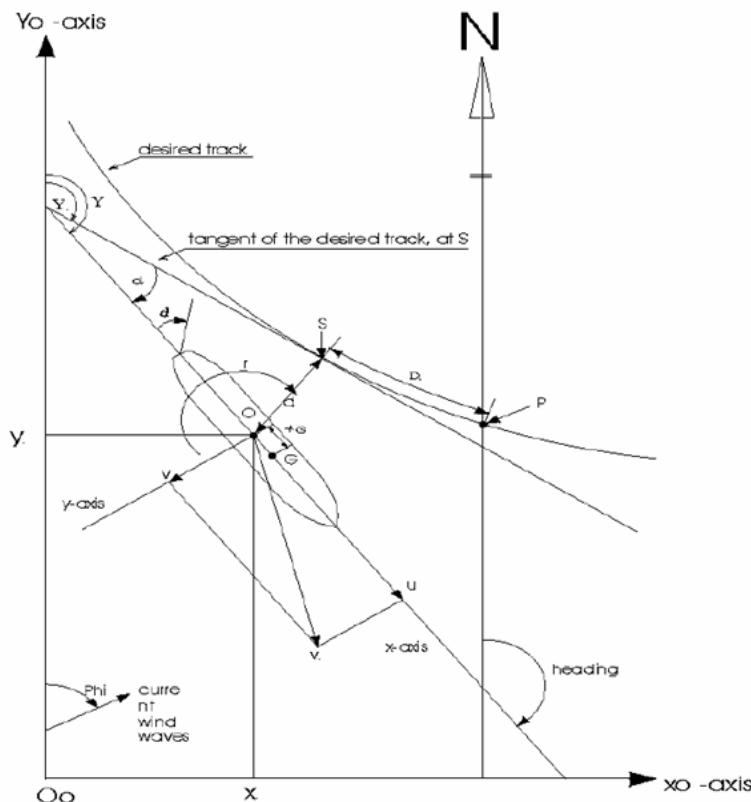

Figura 8 Diagrama de flujo del modelo Shipma

| Asociación Geoestudios – Consusua | Contrato No. 41 – 2011 | Fecha: Julio 2012 | 5 |

Además, Shipma usa dos sistemas de coordenadas. Uno es el sistema propio del programa (x_o , O_o , y_o) y otro es el sistema cartesiano. Ambos sistemas se muestran en la Figura 9.

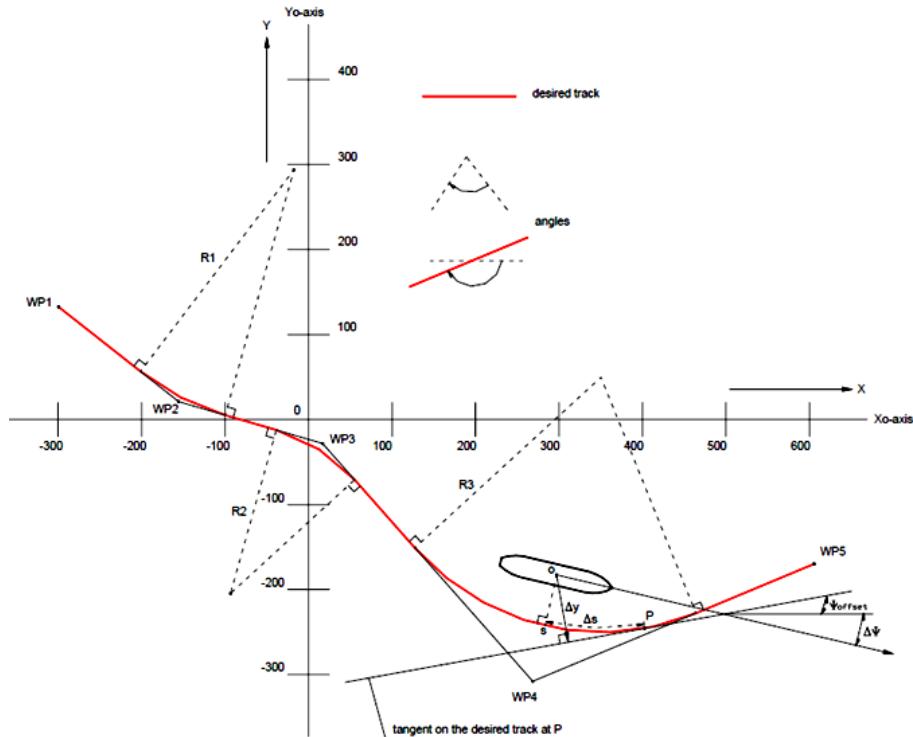

Figura 9 Sistemas de referencia utilizados por el modelo Shipma

Otro factor importante que considera el programa es la maniobrabilidad, esta se calcula por medio de un autopiloto de acuerdo al eje del canal. Después de darle al modelo los parámetros para el cálculo de la maniobrabilidad, este muestra el eje que debe de seguir la embarcación para que cruce el canal sin ningún problema. En la Figura 10 se muestra un ejemplo del eje.

IV. Buque de diseño

El buque utilizado para la modelación es un buque portacontenedores con las siguientes características:

- Eslora: 273 m
- Manga: 32.20 m
- Calado: 11.60 m

A continuación, se presentan los datos y dimensiones de la embarcación. Así como la hoja de datos de la misma.

Valores de corriente para la zona 3, Zona del antepuerto

** CANAL GUAYAQUIL ZONA 1 CONDICION DE FLUJO DE MAREA

** Note:

** Datos de velocidad de corriente obtenidos de la simulación hidrodinámica con el modulo HD del MIKE21

| | | | |
|-------------|--------------|------|--------|
